FREE TRAFFIC PLAYBOOK

Nine SEO moves that still work.

Pulled from a two hour podcast with an SEO who has been doing this for 26 years, then tested on our own site. Includes the one we shipped last night: 18 pages, one question each.

START HERE

One idea sits under all nine

If you only take one thing from this document, take this.

Google does not read your page and decide whether it is good. It cannot. Quality is subjective, and Google has said as much in its own documentation and under oath. What Google can do is count links and count clicks.

Since Caffeine, Google triages the web. It crawls the important part every 24 hours and leaves the rest. A page that gets no clicks stops being re-examined. It does not matter how good that page is. It sits frozen.

> THE CONSEQUENCE
>
> Most pages that are not ranking are not being *judged badly*. They are not being judged at all. Almost every move in this playbook is a way of getting a page re-examined, or of pointing it at a smaller fight it can actually win.

Once you hold that idea, the nine moves below stop looking like tricks and start looking like the same move applied in different places.

HOW TO READ THIS

Two labels to watch for

We do not present everything at the same confidence. Anything marked CONTESTED is one practitioner's reading that other credible SEOs dispute. Anything marked SHIPPED we have run on our own site and can show you.

01

One question, one page SHIPPED

The People Also Ask box is a list of pages Google has already told you it wants.

Open Google, search your main keyword, and expand the People Also Ask box. Every question in there is a question Google has confirmed people ask. Build each one its own page, with the question as the H1 and the answer above the fold.

Most people do the opposite. They put fifteen questions on one page and add FAQ schema. That splits the page's relevance across fifteen keywords that appear in neither the URL nor the title. Schema works if you are Cisco. It does not rescue a site with no clicks.

DO	INSTEAD OF
One question per URL. Question as H1. Answer in the first paragraph, before anything else.	Fifteen questions stacked on one page with FAQ schema, competing with each other.

The objection, answered

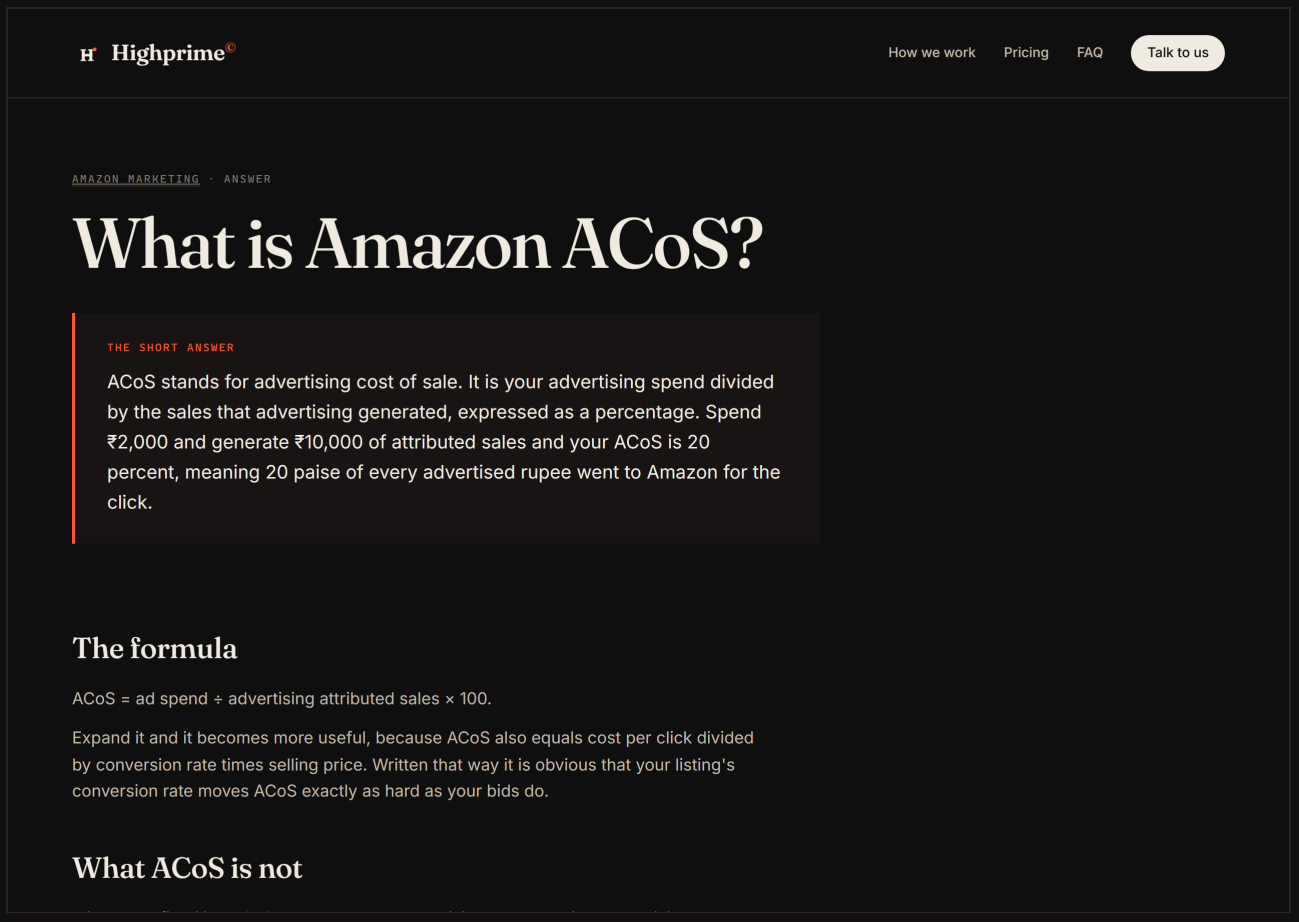

Somebody will tell you these pages are thin content and will be penalised. Read Google's actual spam policy. There is **no minimum word count**, and thin content is named as a problem specifically in the context of affiliate pages. A 200 word page that answers one question completely is a finished page.

> THE RULE THAT STOPS YOU CANNIBALISING YOURSELF
>
> If the page you are targeting **already gets clicks**, do not build a new page. Open Search Console, find the phrases that page ranks on page two for, and add them as H2s on that same page.
>
> New page when clicks are zero. H2s when clicks exist. Same goal, opposite move, and getting this backwards is how people end up competing with themselves.

PROOF

What that looks like built

We ran this on highprimeco.com on 31 August 2026. Every page below is live and you can open it right now.

highprimeco.com · question as H1, answer above the fold, no preamble

Notice what is not there. No introduction, no history of Amazon advertising, no thousand words before the answer. The person searching this has one question, and it is answered in the first sentence they see.

highprimeco.com/what-is-amazon-acos

highprimeco.com/how-to-calculate-acos-on-amazon

highprimeco.com/what-is-tacos-on-amazon

highprimeco.com/how-much-commission-does-flipkart-charge

Four of eighteen. One question each, and the URL is the question.

02

Do not build all of them

This is the part nobody teaches, and it is the part that decides whether this works or buries you.

Twelve searches gave us 44 questions. We built 18 pages. Twelve of the rest were not worth a page at all, and the other 14 belonged on pages we already had. Every question goes into one of four buckets.

44	12	5	9	18
CAPTURED	REJECTED	FOLDED	ABSORBED	BUILT

BUCKET	TEST	WHAT YOU DO
Reject	Is the person asking this our buyer?	Nothing. Questions about the platform's own corporate structure, salary questions from job seekers, and listicles you cannot honestly appear in all get dropped.
Fold	Do we already have a page aimed at this cluster?	Add it as an H2 on the existing page. Building against your own newest page is the most common self inflicted wound in this method.
Absorb	Is this genuinely the same answer?	Make it an H2 inside the answer page it belongs to. Two URLs for one answer means two of your pages compete.
Build	Distinct question, distinct answer, our buyer.	Its own URL.

> DEFINITION AND HOW-TO ARE TWO PAGES, NOT ONE
>
> "What is X" and "How do I do X" look adjacent and are not. One is for somebody who was handed a term in a meeting. The other is for somebody who has already decided and wants steps. When both appear in the same PAA box, Google is telling you it treats them separately. So should you.

03

Republish stuck pages on a new URL

The single most counterintuitive move in this document, and the one with the best story behind it.

You have a page sitting at `Crawled, currently not indexed`. You have hit Request Indexing more than once. Nothing moves. The usual advice is that your content is not good enough.

It is more likely that the page has never had a click, so Google stopped looking at it. The crawler fetches it, compares the file size and last modified date against the previous version, sees no reason to spend indexing budget, and moves on. That can continue for years.

What to do

1. Publish the same content at a new URL, ideally a narrower one (see move 04).
2. 301 the old URL to the new one.
3. Submit the redirect in Search Console.

Google treats the new URL as a new page. New pages inherit the site authority you have *today*, not the authority you had when the original went up. If you have published and earned links in the months since, the page is now judged against a completely different baseline.

> THE CASE
>
> The podcast host had a page stuck at crawled and not indexed for years, on a term he describes as easy. He changed a few words, published at a near identical URL, and 301'd the old one. **Position one within two weeks.** The content was essentially unchanged. What changed was the authority it was measured against.

> READ THIS BEFORE YOU TRY IT
>
> This fixes **crawled, not indexed**. It does not fix **discovered, not indexed**. Discovered and not indexed means Google has not found a reason to fetch the page at all, and the fix there is a link, either an external one or an internal link from a page that already ranks and gets traffic.
>
> You also do not always need a new URL. A page that already ranks and gets traffic can pass that on. Link to the stuck page from your best performing page and it will often start moving on its own.

04

Every slug is an index

Google's engineers built it around a file system. The slug is the document name, and it decides which fight you have entered.

Publish at `/sunscreen` and you have entered a ring with every large beauty brand in the country. Publish at `/best-sunscreen-for-oily-skin-in-india` and you are in a much smaller ring, where the authority you already have may be enough to win.

You have not changed your site's authority at all. You have changed the size of the competition it is measured against. Adding one qualifying word to a URL is the cheapest ranking move available to you.

TOO BROAD

`/sunscreen`

Competing with national brands and marketplaces. Page 900.

WINNABLE

`/best-sunscreen-for-oily-skin-in-india`

Smaller index, real search volume, matches intent.

If you want to know how competitive a term is, search it and read the slugs of the top five results. The answer is sitting in plain sight in the address bar.

> THE FAILURE MODE
>
> You can narrow too far. A slug nobody searches will rank first and bring nothing. Ranking number one for a phrase with no volume is not a win, it is a page you wasted an afternoon on. Narrow until the fight is winnable, then stop.

While you are in there: take your brand name out of page titles

Keep it on pricing, contact and support. Everywhere else it dilutes the title and competes with your own homepage for branded clicks. If your brand name contains a generic word, it also quietly creates cannibalisation you will struggle to diagnose later.

05

Keyword domains still work HANDLE WITH CARE

Exact match domains were devalued. They were not removed.

The example from the podcast is instructive. To compete against companies ten times their size, they bought `freeloadbalancer.com` for the price of a coffee, put a cheap theme on it, and shipped. It produced 600 leads in eight weeks and roughly 160 a month after that. A second site built the same way turned into a client worth a quarter of a million dollars a year.

> WHY IT WORKED, AND THIS IS THE WHOLE POINT
>
> That site was **a real product**. An actual free, throughput limited load balancer that people downloaded and used. It had standalone value, its own reason to exist, and its own audience.

What does not work, and what will eventually get you classified as a doorway site, is buying five keyword domains, filling them with thin blog posts, and funnelling everything to your main site. That pattern is named in Google's spam policy. The distinction is not how many domains you own. It is whether each one is a real thing.

> BEFORE YOU BUY TEN DOMAINS
>
> Cheap first year pricing is not the cost. Renewals are several times the promotional rate, every domain needs its own content and its own maintenance, and the podcast example took eight weeks to produce results *with a real product behind it*. Budget for the second year before you buy the first.

06

Stop disavowing backlinks

Spammy looking links are not the same as link spam. Google is looking for unnatural networks and link farms, and it now tends to zero those links rather than penalise the site receiving them. Appearing on low quality blogs does nothing to you.

The disavow tool is for one situation: **you bought links, you know exactly which ones, and you are cleaning up after yourself.** If you cannot name the links, you are guessing, and disavowing your own good links is a real way to make things worse.

Negative SEO is also much harder to execute than the panic suggests. Done incorrectly it can help the target rather than hurt them.

07

Clicks matter. Dwell time probably does not.

CONTESTED

Flagged honestly, because credible people disagree about this one.

The argument against dwell time as a ranking factor is practical. Blog pages bounce at close to 100 percent by nature, because people read the answer and leave. That is a satisfied visit, not a failed one. Someone may read ten pages, disappear for six months, come back and convert in nine seconds. Punishing the site for that pattern would make no sense.

Click through rate in the results page is different, because that data is entirely inside Google's control. If a lower result consistently earns a better than average click through rate, the order changes. Pogo sticking, going back and picking a different result, is real for the same reason.

> WHERE THE DISAGREEMENT SITS
>
> Other respected practitioners point to material from the antitrust trial suggesting Google may use this data after all. Treat this section as one experienced reading rather than settled fact, and do not rebuild your content strategy around either position.

08

Publish first, judge later

The method that produces volume is uncomfortable if you are a perfectionist. Pick a hundred topics with low competition. Publish them. Roughly seventy will land. Now you have a much easier job, because the thirty that did not are in the same topic clusters as the seventy that did, and a few internal links from the winners will usually pull them up.

The alternative, reviewing every page before it goes live, produces better individual pages and far fewer of them. Nobody can predict which page ranks. The data can, once the page exists.

> THE MINDSET
>
> Google is not watching every move you make. You can publish a page, see it fail, take it down and try again. Reduce the number of things on your checklist until only the ones that move the needle remain, then stop adding to it.

09

Clarity beats cleverness

Two stories about ugly pages that made money.

A landing page review show once pulled up Salesforce's page. Three bullet points, an unattractive form, everything crammed top left. The room wanted to tear it apart. The host stopped them, because he knew the team had A/B tested it a thousand times and it converted.

The second is better. To compete against two competitors charging eight to ten times more, a founder spent a weekend building a single page that was nothing but a comparison table. No logos, no navigation, no design. Both competitors' full product ranges, listed against theirs, with the prices neither competitor published anywhere.

> WHY IT WORKED
>
> Google surfaced the top of the table directly in the results, so the searcher saw all three names and the price gap before clicking. And the page had already done the buyer's homework. They needed to walk into a finance meeting with a comparison, and the page handed them one.

What this means for your pages

Put the answer at the top. One person reported a 33 percent conversion lift from adding a summary line above the fold, and the reason is not sophisticated: people were leaving before finding the answer. Go deeper further down for whoever wants it.

Watch a session recording some time. People do not read your carefully constructed argument. They scan for the specific thing they came for, and if they cannot find it quickly they leave. The most effective ads in one B2B account were little more than lists of acronyms, because the buyer was ticking off requirements and nothing else.

> THE UNCOMFORTABLE VERSION
>
> If your founder says "that should be on the landing page", it usually already is. People are not reading it. That is a clarity problem, not a content problem, and adding more words makes it worse.

DO THIS WEEK

The short version

Nine moves is a lot to hold. These six are the ones you can start on today, in order.

- [ ] **Run the capture.** Search your five main keywords. Expand every People Also Ask box. Write down every question. Expect roughly four per query.
- [ ] **Triage before you build.** Reject anything your buyer would not ask. Fold anything that belongs on a page you already have. Absorb genuine duplicates. Build what is left.
- [ ] **Check Search Console before each new page.** Clicks on the target page mean add H2s. Zero clicks mean build the new page.
- [ ] **Find your stuck pages.** Filter Search Console for crawled and not indexed. Republish the ones that matter at a narrower URL and 301 the old one.
- [ ] **Narrow one slug.** Take your most ambitious page, the one that has never ranked, and add two qualifying words to its URL.
- [ ] **Strip your brand name** from every page title except pricing, contact and support.

> IF YOU DO ONLY ONE
>
> Do the capture and the triage. It costs an afternoon, it needs no tools and no budget, and it produces a build list that is correct rather than merely long.

Highprime ©

IF YOU WOULD RATHER NOT DO IT YOURSELF

We run this for D2C brands.

We find where your buyers already are, on Google, Meta, Amazon, Flipkart and with creators, and we put you there. Nine years in business, twelve developers, an office in Thane.

Our clients average **4.3 ROAS within the first six months**. We work on a monthly retainer or on revenue share, where we take a smaller fee and a percentage of what we generate.
