Ship Thesis Website Audit

Full audit of shipthesis.com: homepage plus the Flutter, SaaS, MVP and AI service pages. November 1, 2026.

This audit reads each page three ways: as a US founder with a budget who has never heard of you, as a senior copywriter, and for conversion and trust.

Scorecard

Page	Score	First impression	Biggest problem
Homepage	7/10	Clear and credible	Services section only shows 2 of your 4 offers
MVP page	7.5/10	Best page: specific timeline, clear terms	Case study is mobile-only; no scope limits or NDA answer
Flutter page	6.5/10	Competent but too narrow	H1 is jargon; proof contradicts the homepage
SaaS page	6.5/10	Solid, templated	Wrong FAQ subtitle; "overseas outsourcing" line backfires
AI page	5/10	Risky	"Zero hallucinations" promise; own product shown as client work

What you're doing right

Keep these, because most new agencies don't have them:

- **Real terms:** fixed price, no hourly billing, code in the client's GitHub from day one, 30/40/30 milestones, 30-day warranty.
- **"Who this is not for" sections.** They build trust and filter bad leads.
- **A working build every Friday.** It's your best differentiator.
- **Honest tone.** "No pitch," "talk to the person who builds it."
- **Real, named projects** with screenshots.

Critical problems (fix before sending any outreach)

1. Your proof contradicts itself across pages

- The homepage says Assess Yourself is "Delivered, launching soon." The MVP page says "10,000+ Verified Users" and "approved on both iOS and Android stores within 4 weeks." The Flutter page says "100% App Store Approval." Those can't all be true.
- The AI page lists Poststeady as "Client: Poststeady," but the homepage says it's "Our own product." Showing your own product as client work looks dishonest when someone clicks through.
- Fix: use only numbers you can show proof for. Show your own products as your own.

2. "Zero hallucinations" in the H1, title tag and meta description

No LLM-based system can promise this. A technical US buyer will read it as a red flag, and "100% Verified Data Accuracy" and "zero metric hallucinations" add to it. Your actual approach is good: numbers are computed in code, and the model only writes around them. Say that instead.

3. Unprovable numbers

"Reduce API bills by up to 70%," "sub-100ms response times," "saving ~50% engineering overhead," "zero technical debt," "0 ms recovery data loss." Cut them or replace them with real numbers from your projects.

4. Timelines disagree

The homepage FAQ says MVPs take 6 to 10 weeks. The MVP and SaaS pages and the outreach plan say 4 to 6. Assess Yourself took 3 to 4. Pick one headline number and explain the range ("4 to 6 weeks for a tightly scoped MVP; larger scopes take longer").

Cross-site issues

- **Templated pages.** The three newer pages reuse the same section intros word for word ("Built for specific founder needs," "Everything you need to launch with confidence"). On the SaaS and AI pages the FAQ subtitle still says "offline persistence, store approval," which doesn't apply. It looks copy-pasted, and near-identical text can hurt your search ranking.

- **Orphan pages.** The MVP and AI pages aren't linked from the homepage services section or the footer. Visitors and search engines can't find them. Four footer links (UX/UI Design, App Maintenance, and two others) point to #services or other pages.
- **No face, no testimonial.** Still the biggest trust gap. One quote each from EHS Guru and Aptellic would help more than any rewrite.
- **No pricing signal anywhere.** With a $2k floor, add "Projects typically start from $X" on the MVP page.
- **No Discovery Sprint.** Your own plan's entry offer isn't on the site.
- **No NDA, payment, or currency answers.** US founders ask these in the first call. Put them in the FAQs: "Do you sign an NDA?", "How do I pay you (USD, invoice, Stripe/wire)?"
- **Jargon density.** Pydantic, Zod, Impeller, JWT, RLS, React Server Components. Fine in the FAQ for technical readers, but the headlines and "What You Get" blocks should use plain language first.
- **The "Verified Case Study" label.** Verified by whom? Remove it or earn it with a client quote.
- **"Overseas" backfires.** "Teams looking for cheap overseas outsourcing mills" (SaaS page) makes US founders think about where you're based. Say "Teams looking for the lowest hourly rate."
- **Tracking.** Hero and final CTAs on service pages share one tag (location=services), so you can't tell which one works.

Page by page

Homepage

- **Hero (7/10):** "From first idea to a live product" is clear but generic. Test: "Mobile apps and SaaS MVPs, live in 4 to 6 weeks. A working build every week, code you own."
- **Services section (6/10):** add all four offers, each with a timeline and a "best for" line. Suggested copy:
  - **MVP Development:** "Your idea as a working product in 4 to 6 weeks. Fixed price, weekly builds." Best for: first-time founders.
  - **Mobile Apps (Flutter):** "iOS and Android from one codebase, submitted to the stores for you."
  - **SaaS & Web Platforms:** "Logins, billing, dashboards. Built on Next.js and Supabase."

    - **AI Features:** "Document parsing and automated reporting, with numbers computed in code."
- Add a Discovery Sprint line under the cards and a "projects start from" note.

MVP page (best page)

- **H1:** keep "Production MVPs for founders, shipped in 4 to 6 weeks" (specific is good). Maybe simplify "Production."
- **Strong:** the 30/40/30 milestone terms, the "burned by slow agencies" hook, and the investor-demo use case.
- **Fix:** the case study is only Assess Yourself, so SaaS buyers see nothing relevant. Add EHS Guru or Poststeady. Add "What's not included in 4 to 6 weeks" so scope is clear. Reword "Non-technical founders looking for equity-only co-founders," because it reads as excluding non-technical founders; use "equity-only or no-budget arrangements." Add FAQs on scope changes, NDA, and payments.

Flutter page

- **H1 and title:** "Flutter app development for founders" works better than "Offline-first mobile apps." Keep offline as a proof point. Subhead: "One codebase for iOS and Android. A working build on your phone every Friday, and code you own."
- **"Not for" list:** replace 3D games and visionOS (no buyer asks for these) with real exclusions: "need it in 1 to 2 weeks," "no weekly decision-maker."
- **Label:** change "STORE GUARANTEE" to "STORE SUBMISSION." Apple decides approval.

SaaS page

- **H1 (6/10):** "SaaS products for founders, built and shipped fast." Try "Custom SaaS for founders: live in 4 to 6 weeks, code you own."
- **CTA copy:** "discuss your database architecture" means nothing to most founders. Use "tell us the problem you're solving."
- **Case study:** EHS Guru is a good story. Turn "$0 Monthly Seat Tax" into a real number: what did they pay before, and what do they pay now?
- **Lead with Stripe,** not Razorpay, for US buyers.
- **The "replace off-the-shelf software" buyer** is a strong niche. Give it its own section.

AI page

- **H1 (5/10):** "Applied AI products for founders, with zero hallucinations." Try "AI features that get the numbers right. Built for products where wrong answers cost you customers."
- **Title and meta:** drop "Zero Hallucinations." Use "Applied AI Product Development for Founders."
- **Case study:** show Poststeady as your own product, and be clear what the AI does and what code does.
- **Advice:** this page has one case study, and it's your own. Don't lead with AI in outreach yet. Use MVP and Flutter or SaaS.

Priority list (in order)

1. Resolve the AssessYourself and Poststeady claims (today, about 30 minutes).
2. Remove "zero hallucinations," "up to 70%," and the other unprovable numbers (1 hour).
3. Unify the timeline: one headline number everywhere (30 minutes).
4. Add the founder section and ask both clients for a one-sentence testimonial (1 to 2 hours, plus waiting).
5. Rewrite the homepage services section with all four offers and add them to the footer (2 hours).
6. Fix the copy-pasted FAQ subtitles and the "overseas" line (30 minutes).
7. Add Discovery Sprint, a "starts from" price line, and NDA/payment FAQs to the MVP page (2 hours).
8. Rewrite the Flutter, SaaS, and AI H1s and title tags (1 hour).
9. Give each page a case study that fits its audience (later, once you have more proof).

What I couldn't check

I couldn't see the collapsed "Show 5 more questions" on the homepage, the individual case study pages under /work/..., or how the pages look on mobile. Those could add more issues.

Replacement copy

Paste-ready copy for the homepage and the four service pages. Anything in [square brackets] is something only you can fill in. I haven't invented numbers, quotes or prices.

Assumptions behind this copy (change them if they're wrong):

- 4 to 6 weeks is the headline timeline for a tightly scoped MVP. Larger scopes take 6 to 10 weeks.
- The Discovery Sprint exists as a paid first step, with the fee credited if the client builds with you.
- You're comfortable saying you work remotely from India. I recommend it, because hiding it raises more doubt than saying it.
- Assess Yourself is delivered but not yet launched, so it shows no user numbers until it is.

Homepage

Hero

H1 (recommended): Your app idea, live in 4 to 6 weeks.

Other H1s to test:

- Mobile apps and SaaS MVPs, built in weeks. Code you own.
- From idea to a working product, with a new build to test every week.

Subheadline: We build mobile apps and SaaS MVPs for founders. A working build on your phone every week, a fixed price in writing, and code you own from day one.

Buttons: Book a free 20-minute call | See our work

Trust line (make this larger and darker than it is now): 20 minutes. No pitch. You leave with a clear next step.

Badges: keep as they are (100% code you own, Weekly working builds, Fixed-scope milestones).

Proof strip

Keep "Built & shipped by Ship Thesis." Label Poststeady and ChromaLayer as "Our own product" everywhere, and keep Assess Yourself as "Delivered, launching soon" until it launches.

What we build (services section)

Heading: What we build

Subheading: Four ways we help founders get to launch.

Card 1: MVP development

- Tag line: Fixed price · Weekly builds · 4 to 6 weeks
- Description: Your idea as a working product in 4 to 6 weeks. A strict written scope, a build to test every week, and code in your GitHub from day one.
- Link: Explore MVP development →

Card 2: Mobile apps

- Tag line: Flutter · iOS · Android
- Description: One app for iPhone and Android, built from a single codebase. We also handle App Store and Play Store submission.
- Link: Explore mobile apps →

Card 3: SaaS and web platforms

- Tag line: Next.js · Supabase · Billing
- Description: Logins, payments and dashboards, built around how your business works. A good fit if off-the-shelf software no longer does.
- Link: Explore SaaS and web platforms →

Card 4: AI features

- Tag line: Documents · Reports · Automation
- Description: Turn messy PDFs and spreadsheets into structured data and reports. Numbers are calculated in code, so the AI never makes them up.
- Link: Explore AI features →

Strip under the cards (Discovery Sprint): Not sure what to build first? Start with a 1-week Discovery Sprint: a scoped plan, approved screens and a fixed quote for the build, for [$X]. The fee is credited if you build with us. [Link: Ask about the Discovery Sprint →]

Line at the bottom: Need something else, like desktop software or internal tools? Tell us what you're building on a free 20-minute call →

Layout fixes from the screenshot: keep each tag line to one line so the cards align, and use a populated dashboard image (for example the EHS Training Platform) instead of the empty one.

Who you'll work with (new section, place after the case studies)

Heading: You'll work with the person who builds it.

Body: I'm [Your name], founder and lead engineer at Ship Thesis. [One sentence about your background that you can back up.] I built [EHS Training Platform for EHS Guru], [Poststeady] and [ChromaLayer], and delivered [Assess Yourself] for Aptellic. No account managers and no handoffs: you talk to me, and I write the code.

Detail line: Ship Thesis works remotely from India. Calls are scheduled in your time zone, and we use a private Slack Connect channel and a weekly video demo.

Button: Book a free 20-minute call

Add: a clear photo of you, and one client quote beside it (see the testimonial request in the shared blocks).

Homepage FAQ: replace these answers

How long does it take to build an MVP?

A tightly scoped MVP usually takes 4 to 6 weeks. Larger scopes, with several user roles or many integrations, take 6 to 10. Assess Yourself was delivered in 3 to 4. In every case, you test a working build every week.

How much does it cost?

Every project gets a fixed price in writing after the free call. We never bill hourly. MVP projects typically start from [$X], and the price depends on the number of screens, integrations and platforms.

Do you sign an NDA?

Yes. We can sign yours before you share your idea in detail, or send ours.

How do I pay you?

In US dollars, by invoice, in milestones tied to working builds. [Add the payment methods you accept.]

Homepage title and meta

Title: Ship Thesis | MVP, Mobile App and SaaS Development for Founders

Meta description: We build mobile apps and SaaS MVPs for founders in 4 to 6 weeks. A working build every week, a fixed price, and code you own.

MVP development page

Title tag: MVP Development for Startups | Fixed Price, 4 to 6 Weeks | Ship Thesis

Meta description: We build your MVP in 4 to 6 weeks for a fixed price. Weekly working builds, milestone payments, and code in your GitHub from day one.

Hero

H1: Your MVP, live in 4 to 6 weeks. Fixed price, weekly builds.

Subheadline: Turn your product idea into software real customers can use. Test a working build every Friday, pay by milestone, and own the code from day one.

Buttons: Book a free 20-minute call | See how it works ↓

Trust line: 20 minutes · No pitch · You speak directly with the person who builds it.

Who this is for

Heading: Built for founders who want to launch, not just plan.

- **Founders testing a real idea.** You've talked to customers, have pre-orders or a pilot lined up, and need working software in front of them soon, without spending months of runway.
- **Founders burned by slow agencies.** You want to talk to the person writing your code, agree the scope in writing, and see a working build every Friday instead of status reports.
- **Startups heading into a demo or pilot.** You need real logins, payments and a secure database, so the product holds up in an investor demo or a customer's technical review.

Who this is not for

Heading: When we're not the right fit.

- **Hourly or open-ended work.** We work on a fixed scope and a fixed price, agreed in writing before we start.
- **Everything in version one.** We'll help you cut features until the first version can launch in weeks, not quarters.
- **Equity-only or no-budget deals.** Our projects are paid by milestone, and you own 100% of the code.
- **Projects with no one to make weekly decisions.** A weekly build only works if someone can review it and decide quickly.

How a 4 to 6 week MVP works (new section)

[Confirm whether the Discovery week is inside the 4 to 6 weeks, and edit the timing.]

1. **Week 1, Discovery.** We agree what goes into version one, design the key screens for your approval, and give you a fixed quote.
2. **Weeks 2 to 5, Build.** Every Friday you get a working build on your phone or a staging link. You test it and tell us what to change.
3. **Final week, Test and launch.** We test everything, then submit to the stores or deploy to production.
4. **After launch, 30-day warranty.** We fix bugs and unexpected problems at no charge.

What's included (new section)

Included: product scope and plan, approved screen designs, the app or web product itself (Flutter or Next.js), a backend with logins, payment setup (Stripe or Razorpay), and store submission or web deployment.

Usually not included in 4 to 6 weeks (edit to match what you really do): a mobile app plus a web app plus an admin system all at once, custom-trained AI models, content writing, and marketing.

Case studies

Show two, so mobile and web buyers both see themselves.

Assess Yourself, a mobile MVP for Aptellic. An exam-prep app. Students need practice tests to keep working with a weak signal or a dead battery, so the app saves progress on the phone and restores a timed test exactly where it stopped. Delivered in 3 to 4 weeks.

- Stats: 3 to 4 weeks from idea to delivery · iOS and Android from one codebase · 100% of the code owned by the client

- [Add "Live on both stores" and real user numbers only once they're true.]

EHS Training Platform, a web platform for EHS Guru. EHS Guru was paying for a bloated off-the-shelf learning system. We built a simple platform with only what they use: one-click Zoom classes, automatic attendance tracking, and recordings in the student dashboard. Built in 4 weeks, live since May 2026.

- Stats: 4 weeks to build · Live since May 2026 · No per-seat software fees [add what they paid before]
- [Add a one-sentence quote from EHS Guru.]

Remove the "Verified" label on case studies unless you can show how they're verified.

What you get

Heading: What you get when you work with us.

- **A fixed price in writing.** Payments in three milestones: 30% at kickoff, 40% when the halfway build works, 30% at final release. No hourly billing.
- **A working build every Friday.** Test real software on your phone or in your browser, not slides.
- **Your code from day one.** A private repository in your company's GitHub. All the intellectual property belongs to you.
- **Ready for real customers.** Secure logins, payments, a protected database and automatic backups, set up for launch.

FAQ (replace the four with these)

What's included in a 4 to 6 week MVP?

Everything needed to put a first version in front of customers: the plan and scope, approved screens, the app or web product, a backend with logins, payment setup, and store submission or deployment.

How much does it cost?

Every project gets a fixed price in writing after the free call. MVP projects typically start from [$X]. The price depends on screens, integrations and platforms.

How does the fixed-price milestone model work?

We agree a written scope before any work starts. You pay in three milestones, 30% at kickoff, 40% when the halfway build works, and 30% at final release, and you only release each payment after testing working software.

What if my scope changes?

Small adjustments within a milestone are fine. If a change adds work, we tell you what it does to the time and price in writing before we do it, and you decide.

Do I own all the code and IP?

Yes, 100%. We build in your company's GitHub from day one, and our contract assigns all intellectual property to you.

Do you sign an NDA?

Yes. We can sign yours before you share your idea in detail, or send ours.

How do I pay you?

In US dollars, by invoice, in milestones. [Add the payment methods you accept.]

Can you build from my designer's Figma?

Yes. We build to your design and flag anything that won't work on a phone before we start.

Where are you based, and how do we communicate?

We work remotely from India. Calls are scheduled in your time zone, with a private Slack Connect channel and a weekly video demo.

What happens after launch?

Every MVP includes a 30-day warranty for bugs and unexpected problems, at no cost. After that you can keep us on a maintenance plan for new features, or hand the documented codebase to your own team.

Final call to action

Heading: Ready to get your MVP built?

Body: Book a free 20-minute call. Tell us what you want to build, and we'll tell you honestly whether it fits a 4 to 6 week MVP. After the call you get a written scope, timeline and milestones.

Button: Book a free 20-minute call

Under the button: Not ready for a call? Email your idea to info@shipthesis.com and we'll reply with a first read within [one business day].

Flutter mobile app page

Title tag: Flutter App Development for Startups and MVPs | Ship Thesis

Meta description: Flutter apps for iOS and Android from one codebase. A working build on your phone every Friday, store submission handled, and code you own.

Hero

H1: Flutter app development for founders

Subheadline: One codebase for iOS and Android. A working build on your phone every Friday, and code you own from day one.

Buttons: Book a free 20-minute call | See the case study ↓

Trust line: 20 minutes · No pitch · You speak directly with the person who builds it.

Who this is for

- **Founders launching on iOS and Android together.** Reach App Store and Google Play users from day one without paying for two separate apps.
- **Apps that must work with a weak signal.** Exam tools, field checklists, inventory and notes apps keep working offline and sync when the connection returns.
- **Founders who want to test on a real phone.** Every Friday a new build lands on your phone through TestFlight (iPhone) or a download link (Android), so you judge real software, not mockups.
- **First-time founders who want clear next steps.** We explain choices in plain language and agree each milestone in writing.

Who this is not for

- **Heavy 3D games.** Games with custom graphics engines are better built in Unity or Unreal.
- **Apps for Apple devices only.** If you only need iPhone or Apple Vision Pro, native Swift may be the better fit.
- **A website in an app wrapper.** We build real Flutter apps, not a website packed into a shell.

- **Projects without budget for a fixed-price build.** We price by scope, so we're not the cheapest option.

Case study

Use the same Assess Yourself text as on the MVP page. Show the three real app screens, and use these stats only: 3 to 4 weeks from idea to delivery · iOS and Android from one codebase · timed tests that restore after a crash or dead battery. Replace "0 ms recovery data loss" and "10,000+ verified students" until you can prove them.

What you get

Heading: What you get with every mobile app.

- **A build every Friday.** A fresh version on your phone through TestFlight and a download link for Android.
- **Store submission handled.** We set up your developer accounts, signing and store listing, submit the app, and fix review issues until it's approved.
- **Your code from day one.** A clean, documented project in your company's GitHub, with all the intellectual property assigned to you.
- **Works offline.** Data is saved on the phone first and syncs when the signal returns.

FAQ

Why Flutter instead of separate iPhone and Android apps?

Native apps need two codebases and two rounds of testing. Flutter lets us build one app for both platforms, which usually means lower cost and faster delivery, with a smooth, native feel. [Add a real cost comparison only if you can back it up.]

How much does a Flutter app cost?

Every project gets a fixed price in writing after the free call. Mobile MVPs typically start from [$X], depending on screens, integrations and whether the app must work offline.

How long does it take?

A tightly scoped mobile MVP takes 4 to 6 weeks. Assess Yourself was delivered in 3 to 4. You test a working build every Friday.

Will it work offline?

Yes, if your product needs it. The app saves your data on the phone first, keeps working without internet, and syncs automatically when the connection comes back.

How does App Store and Play Store approval work?

We handle the whole submission: developer accounts, signing keys, privacy details, screenshots and the review itself. If Apple or Google ask for changes, we make them.

Can you build from my designer's Figma?

Yes. We build to your design and flag anything that won't work on a phone before we start.

What happens after launch?

Every project includes a 30-day warranty for bugs and unexpected problems, at no cost. After that you can keep us on a maintenance plan for new features, or take the documented codebase in-house.

Final call to action

Heading: Ready to build your mobile app?

Body: Book a free 20-minute call to talk through your app idea, whether it needs to work offline, and what a first version should include.

Button: Book a free 20-minute call

Use a different tracking tag for the hero button and this one so you can see which converts.

SaaS and web platforms page

Title tag: SaaS MVP Development for Founders | Ship Thesis

Meta description: We build SaaS products with logins, billing and dashboards in 4 to 6 weeks. Weekly working builds, a fixed price, and code in your GitHub.

Hero

H1: Custom SaaS for founders, live in 4 to 6 weeks

Subheadline: Web apps with logins, billing and dashboards, built around how your business actually works. A working build in your browser every week, and code you own.

Buttons: Book a free 20-minute call | See the case study ↓

Trust line: 20 minutes · No pitch · You speak directly with the person who builds it.

Who this is for

- **Founders building a web product.** You need user accounts, roles, workflows, payments and connections to other tools, built properly the first time.
- **Businesses replacing software that doesn't fit.** You pay per-seat fees for software that doesn't match how you work. We build only what you use, and you own it, with no per-seat fees.
- **Teams that want a solid base, not a patchwork.** A properly built codebase with database migrations, so you aren't forced to rebuild when you grow.

Who this is not for

- **A simple brochure website.** If you only need a landing page or blog, a website builder is cheaper and faster.
- **Multi-year projects with no early customers.** We build focused products meant to reach real paying users in weeks, not committee projects.
- **The lowest hourly rate.** You'll find cheaper hourly developers. We offer a fixed price, a build every week, and code you own.

Case study

EHS Training Platform for EHS Guru. EHS Guru was paying for a bloated off-the-shelf learning system. We built a simple platform with only what they use: one-click Zoom classes, automatic attendance tracking, and recordings in the student dashboard. Built in 4 weeks, live since May 2026, and now on our maintenance plan.

- Stats: 4 weeks to build · Live since May 2026 · No per-seat software fees [add what they paid before]
- Replace the "$0 Monthly Seat Tax" box with a real before-and-after figure, and add a one-sentence quote from EHS Guru.

What you get

Heading: What you get with every web platform.

- **Logins and permissions.** Sign in with an email link or Google. Roles such as Admin, Member and Viewer decide who sees what.

- **Billing and integrations.** Stripe subscriptions and invoices (or Razorpay for India), plus tools like Zoom and email. Failed or changed payments update accounts automatically.
- **Dashboards and exports.** Clear tables and key numbers that work on a phone, with PDF and CSV downloads.
- **Your code from day one.** A private repository in your company's GitHub, with all the intellectual property assigned to you.

FAQ

How much does it cost, and how long does it take?

Web platforms typically take 4 to 6 weeks for a tightly scoped first version, and start from [$X]. Every project gets a fixed price in writing after the free call.

How do payments and billing work?

We set up Stripe so customers can pick a plan, update their card, download invoices and cancel on their own. When a payment succeeds or a subscription changes, their account permissions update automatically.

How do users sign in?

With a passwordless email link or Google or GitHub sign-in. Each customer's data is separated at the database level, so one customer can never see another's.

Can it handle many customers?

Yes. We build on managed services that handle thousands of users, size the setup for your launch, and tell you honestly when it needs more. [Add real numbers from a project you've run, or leave this general.]

What happens after launch?

Every project includes a 30-day warranty for bugs and unexpected problems, at no cost. After that you can keep us on a maintenance plan for new features, or hand the documented codebase to your own team.

Final call to action

Heading: Ready to build your web platform?

Body: Book a free 20-minute call and tell us the problem you're solving. We'll tell you what a first version should include and how long it would take.

Button: Book a free 20-minute call

AI product page

This page has one case study, and it's your own product. I wouldn't lead with it in outreach yet. The copy below is written to be accurate, because a technical buyer will test the claims.

Title tag: AI Product Development for Founders | Ship Thesis

Meta description: We build AI features for documents and reporting, where the numbers are calculated in code and checked before they reach your customer.

Hero

H1: AI features that get the numbers right

Subheadline: We build products that turn messy PDFs, spreadsheets and text into structured data and reports, for founders who can't afford wrong answers.

Line under the subheadline: Numbers are calculated in code and checked before they reach your customer. The AI writes the explanation around them.

Buttons: Book a free 20-minute call | See the case study ↓

Who this is for

- **Products where accuracy matters.** Reporting, finance, legal and compliance work, where one wrong figure loses a customer. We keep the numbers out of the model's hands.
- **Teams automating manual document work.** You process multi-page PDFs, messy spreadsheets or free text, and want clean, structured data in your database.
- **Founders who want AI without a huge API bill.** We use smaller, cheaper models for simple steps and save larger ones for the hard parts.

Who this is not for

- **A generic chatbot.** If you only want a chat window with no data or business rules behind it, an open-source template is cheaper.
- **Training your own model from scratch.** We build products on commercial models from providers like Anthropic, OpenAI and Google.
- **Experiments with no testing.** We build checked, tested software, not prompts that break when a model updates.

Case study

Poststeady, our own product. Agencies spend hours turning analytics exports into client reports. Poststeady turns messy CSV exports into a branded PDF report with the analysis written out. We built it in 4 weeks and run it ourselves, and it has 100+ users.

- Label it "Our own product," not "Client."
- Stats: 100+ users · Built in 4 weeks · [add time saved per report, and the PDF build time only if you've measured it]
- Remove "100% Verified Data Accuracy" and "zero metric hallucinations."

What you get

Heading: What you get with every AI build.

- **Checked outputs.** Every AI answer is checked against a strict format. If it doesn't fit, it's rejected and retried.
- **Your data stays yours.** We use business plans from providers whose terms say customer data isn't used to train their models. [Confirm each provider's current terms before publishing.]
- **Costs kept in check.** Simple steps run on small models and saved results. Once it's live, we show you what each task costs.
- **Your code from day one.** A private repository in your company's GitHub, with all the intellectual property assigned to you.

FAQ

How do you stop the AI from making things up?

No model can promise it will never be wrong, so we design around that. Numbers are calculated in regular code first. The model only writes the explanation around those exact figures, and we check its output against a strict format and test it before release.

Will our data be used to train AI models?

Not on the business plans we use. [Confirm with each provider's current terms before publishing.]

How do you manage API costs?

We use small, cheap models for simple steps, reuse saved results where we can, and save larger models for complex work.

How will we know it's accurate enough?

We test it on your real documents and agree what "good enough" means in writing before launch. [Only keep this if you offer it.]

What happens after launch?

Every project includes a 30-day warranty for bugs and unexpected problems, at no cost. After that you can keep us on a maintenance plan, or take the documented codebase in-house.

Final call to action

Heading: Ready to build your AI product?

Body: Book a free 20-minute call and tell us what documents or data you're working with. We'll tell you what's realistic for a first version.

Product: Home · Work · How it works · FAQ · Contact

Remove "UX / UI Design," "App Maintenance," "Backend Development" and "App Store Submission" until each has its own page or section, because they currently lead back to the same places.

Message to ask clients for a testimonial

Hi [Name], thanks again for working with me on [project]. I'm updating my website and would love a short quote from you. Could you reply with two or three sentences on what problem you had, what it was like working with me, and the result? I'll send you the final wording to approve before anything goes live. You can be named with your role and company, or just a first name, whichever you prefer.

Send it to EHS Guru and Aptellic first.

Your decisions and facts checklist

These are the blanks in the copy above that only you can fill in:

1. The starting price for MVPs, and for each service page.
2. The Discovery Sprint price, and whether the fee is credited against the build.
3. Whether the Discovery week is inside the 4 to 6 weeks.
4. The real status and numbers for Assess Yourself, including whether it's live on both stores.
5. What EHS Guru paid per seat before, so the "no seat fees" claim becomes a real number.
6. One client quote each from EHS Guru and Aptellic.
7. Your name, photo, and one sentence of background that you can back up.
8. The payment methods you accept.
9. A response time for the email option.
10. Each AI provider's current data terms, before you publish the "your data stays yours" claim.
11. Whether Poststeady's PDF build time and report time-saved figures have been measured.
12. Whether you're happy to say you work from India.
